Flexible and Integrable System

The central enterprise system is of no use without being integrated into other specialised external systems. Therefore it is crucial to consider integrating the system into the existing system environment when designing a new system.

It is also important to think of the system with the systems planned to be launched in the future. Integration requires careful consideration of the granularity level of the services offered and selection of suitable service-orientated architecture.

We recommend, design and implement solutions using maximum of platform independent technology. Why?

To meet the clients' requirements we are ready to fully adapt our solutions to the platform in customer's environment, or to the preferred platform, whether it is the operating system, or application development platform. We prefer platform-independent Java applications supported by all commonly used platforms and operating systems.
