SimManager

Customer

End customers are mainly large international companies. Currently we are for example involved in projects for big automotive manufacturers, aircraft manufacturers, communication technology giants and others.

Simple Solution Overview

Thanks to the outsourcing of our human resources we participate in the development of SimManager - a software for simulation management. It is a product of MSC Software, US based company with experience of 50 years in computer-aided engineering (CAE).

Description

SimManager is a simulation process and data management system that manages all aspects of CAE simulation. It focuses on organization of a simulation data and processes. It covers complete life cycle: from the project creation all the way to final reports generation.

It is a web based information system which can be deployed at various enterprise environments and infrastructures. It is integrable with amount of additional tools such as solvers, distributed/scalable technical solutions, etc.

Plaut Slovakia provides resources which are involved in two main lines of SimManager development:

— Development of the product (Core) in cooperation directly with MSC Software headquarters in USA

— Customization of the "out-of-the-box" product to specific requirements of a customer (Services). In this case we cooperate with MSC Munich.

Very often we provide "on-site" support at the customer as a part of the project.
